

# Two Boilers in One

## ThermoSteam's Dual-Boiler

### Efficiency:

*Designed for improved efficiency, low utility cost and compact design.*

**"Steam storage capacity of a horizontal boiler!  
The performance and space savings of a vertical boiler!"**

### Flexibility:

*Runs on one burner during non-peak steam demand and will return to full fire if the load increases.*

**"Pay only for the steam you need and reduce your energy costs!"**

### Dual Function:

*Either burner can operate independently. If one requires maintenance the second burner can still function.*

**"Your business can continue to operate!"**

### Insta-Therm Design

*Condensate, tank and pump built right into the boiler. All components and controls are pre-mounted, factory plumbed and wired.*

**"No external parts to buy or install. Avoid the hassle of an onsite assembly. Saves you more time and money!"**

### Fast Recovery:

*A full head of steam in under 15 minutes from a cold start.*

**"Generates greater fuel savings!"**

### Space Saver:

*Dual-boiler can often fit in boiler rooms, where a single large boiler with the same capacity won't.*

**"Saves valuable floor space!"**

**The most performance, in the least space,  
for the lowest price!**
