Two Boilers in One!

ThermoSteam Systems, Inc. Dual-Boiler System with Lead-Lag Control!

The unique design of this Dual-Boiler system, assures efficient, reliable performance and versatility of function. The Dual-Boiler with Lead-Lag control, has the steam storage capacity of a horizontal boiler and the performance and space saving compact design of a vertical boiler. It fits into boiler rooms where a single large boiler of the same capacity cannot, saving valuable floor space.

Most boilers are either all "on" or all "off"

The lead-lag sequencing control of our Dual-Boiler provides overall combustion efficiency and burner stability when loads and demands are variable. It can run on one burner during non-peak steam demand and then return to full fire when the load increases. With a Dual-Boiler you pay only for the steam you need. The result is greater fuel savings and less downtime. If either burner requires maintenance, the second burner can still function, so production is never interrupted.

Like all ThermoSteam boilers, the Dual-Boiler utilizes our Insta-Therm design; which means the condensate tank and pump are built right into the boiler. The return water is pre-heated to achieve even more fuel savings. All components and controls are pre-mounted, factory plumbed and wired. There are no external parts to buy or install. The Dual-Boiler system is available in 6 models from 25 to 120 Bhp.

For more information, drycleaner owners can contact ThermoSteam, toll free at 800-548-9643 for full details and the name of the closest authorized ThermoSteam Distributor. Visit our website at www.ThermoSteam.com.
